Read Features of the Datasets

The dataset we used are pictures of different people.The name of each picture contains the date of birth and photo taken date of the person.The 'wiki.mat'file records some other information such as genders,names and so on.This step is to read the information of this file.

```python
import scipy.io
mat = scipy.io.loadmat('./wiki_crop/wiki.mat')
print(mat)

Create a Dataframe

Converting the information we need("photo_taken", "full_path", "gender","face_score") in the 'wiki.mat' file into a pandas dataframe.

In [2]:

```python
instances = mat['wiki'][0][0][0].shape[1]

columns = ["dob", "photo_taken", "full_path", "gender", "name", "face_location", "face_score", "second_face_score"]

import pandas as pd
df = pd.DataFrame(index = range(0,instances), columns = columns)

for i in mat:
    if i == "wiki":
        current_array = mat[i][0][0]
        for j in range(len(current_array)):
            df[columns[j]] = pd.DataFrame(current_array[j][0])
print(df)
```

Calculate the Age

We use the information of "photo_taken", "full_path"(which contains the time of birth) to calculate the actual time of birth of the person (unit as year, for example:year of birth: 1995.50 represents the actual date of birth:07/01/1995)using the following formulations.

In [3]:

```python
from datetime import datetime, timedelta
def datenum_to_datetime(datenum):
    days = datenum % 1
    hours = days % 1 * 24
    minutes = hours % 1 * 60
    seconds = minutes % 1 * 60
    exact_date = datetime.fromordinal(int(datenum)) \
    + timedelta(days=int(days)) + timedelta(hours=int(hours)) \
    + timedelta(minutes=int(minutes)) + timedelta(seconds=round(seconds)) \
    - timedelta(days=366)
    return exact_date.year

df['date_of_birth'] = df['dob'].apply(datenum_to_datetime)
```

obtain the age using the actual time of birth we calculated above and photo taken time.

In [4]:

```python
df['age'] = df['photo_taken'] - df['date_of_birth']
```

Remove "Noisy" pictures

Some pictures don't include face of the people in the wiki data set.And some images of people have wrong or missing information.For example,age information is missing for some records.Also some pictures are too vague to detect.These pictures may confuse the model.We should take some steps to ignore of drop them.In the following steps,we removed the pictures that do not include face,include more than one face and do not have a gender information.

In [5]:

```python
import numpy as np
#remove pictures does not include face
df = df[df['face_score'] != -np.inf]

#some pictures include more than one face, remove them
df = df[df['second_face_score'].isna()]

#check threshold
df = df[df['face_score'] >= 3]

#some records do not have a gender information
df = df[~df['gender'].isna()]

df = df.drop(columns = ['name','face_score','second_face_score','date_of_birth','face_location'
])
```

Remove the images that have ages more than 100 or less than 0

In [6]:

```python
#some guys seem to be greater than 100. some of these are paintings. remove these old guys
df = df[df['age'] <= 100]

#some guys seem to be unborn in the data set
df = df[df['age'] >= 0]
```

Reclassify Data

We create 100 folders to contain the images with ages from 0 to 100.Each folder name corresponds to the images of people with that age.(for example,folder 20 contains all images of people aging 20). This step is to unify the data form so we can use the data generator in the following training process.

In [7]:

```python
import os,shutil
def mycopyfile(df):
    dst = './test'
    dir_exists = os.path.isdir(dst)
